Subject: Dataset Posted by Sajama on Wed, 05 Jul 2017 11:49:29 GMT View Forum Message <> Reply to Message

Hi, I am new in using DHS dataset. Actually, I am doing a trend analysis in stunting using four dataset of Nepal. What I am confused is, I could see there are number of variables representing same variable like HC4\$1 HC4\$2 HC4\$3 HC4\$4 for height for age percentile. similarly, there are six variable for "height of children taken lying or standing" HC15\$1 HC15\$2 to HC15\$6 in NDHS 2011. Both are not multiple response. In this case, how to identify which one to use for analysis.

When I checked data manual, it only explains about the meaning of variable but does not give information on subset of variable. Please help me sort out my confusion.

The DHS Program User Forum

Thank you Sajama
