I am working with NFHS4 raw data. Many times my analysis is not matching with National Report. Tried to sort out this issue, discussed with various people, but couldn't succeed. For example the number given in the national report of children born in the two years preceding the survey who ever breastfed is greater than the total number of children which includes both who breastfed and not. How come that number will be greater than this total number. This is only one example, there are many other issues as well. I have used weights and all, followed every statistical procedure explained by USAID people.
