Hello,

I would like to have some advice on the following issues:

(1) If I want to run a regression model to examine the effect of different determinants on nutrition outcomes of children under 5 years of age, can I use only the children data file (BDKR file), Or I have to use/merge other files such as births data file?

(2) What is the standard method of dealing the flagged cases? Is it important to include flagged cases during the analysis?
