Hello,

For the family planning client observation and exit data in the 2012-2013 Senegal SPA, would you kindly provide details on the sampling strategy? For example, is there stratification to account for? In the Senegal SCSPA 2012-2013 report, it notes that "the sample encompassed 50 percent of hospitals, 50 percent of health centers including garrison medical centers (GMC), 20 percent of health posts including infirmaries..."

Also, does the client weight found in the FP observation/exit data account for health provider and health facility weights from the other SPA data files?

Thank you in advance,  
Christina Juan
