I was wondering whether the lat-long data contained by the 'service availability' data-file from the Bangladesh DHS are associated with the original or displaced cluster locations? I know that data in the available shape-files correspond to the displaced cluster locations and common sense dictates that that strategy must have been adopted for other cases too. Just wanted to be absolutely sure of that.

Can you please specify which data files you are referring/using to, so we can be absolutely sure that we are giving you the correct information.

Thanks, first of all, for your kind reply. As for your inquiry, say, I'm going to use the file 'bdsq61dt.zip' (under the category 'Service Availability Raw') from Bangladesh DHS 2011 which contains cluster-level information on different variables, 'latitude', 'longitude' being two of them.

Hope I've answered your question, and thanks in advance for your response.
