Dear fellow users,

I use NFHS-3 (DHS India 2005-6), the children's file + women's domestic violence variables, and set up the survey variables in Stata accordingly, following <http://dhsprogram.com/faq.cfm> and <http://userforum.dhsprogram.com/index.php?t=msg&th=1217&start=0&S=221608a0f19ba7cd3b19146ec73a3903> :

```
gen weight=v005/1000000  
egen strata = group(v024 v025), label  
tab strata
```

```
svyset [pweight=weight], psu(v021) strata(strata)
```

Now, I would like to calculate statistics using the svy: commands, including svy: mean.

I ran for example, just to see if it works:

```
svy: mean hw70 (hw70 is Height for age standard deviation)  
svy: mean hw1 (age in months)
```

Every time I do this, I get the following error message:

```
(running mean on estimation sample)  
no observations  
r(2000);
```

I researched online in stata forums as well as in this forum and could not find any useful hints.

Thank you very much for giving me advice.

Just solved the problem myself, but cannot delete my post.

Solution:

The variable v021 does not contain any values. Instead, s021 needs to be used.

Here are comments from Senior DHS Stata Specialist, Tom Pullum:

The children's variables are in the KR file and the domestic violence variables (d\*) are in the IR file. You must have done a merge, and I suspect that your problem is with the merge. Sometimes a merge can end up with an empty file. How many cases do you have in the merged file? Can you calculate the desired means WITHOUT the svy command?

Another comment. The pweight option does not require that you divide v005 by 1,000,000. Pweights are automatically normalized to have a mean of one. You could multiply or divide v005 by any number whatever, and it would not alter the results.

Hi,

I am using a dataset with the children's files from the 3 waves appended (NFHS India -1,2,3). I need to setup the survey variables in Stata using svyset. However, I am unsure about which variable to set as psu.

v021 has information for waves 1 and 2 whereas the information for wave 3 is in s021. However, the values of these 2 variables are not comparable.

For example:

	v021	s021	v000
37.	4	.	IA2
39.	6	.	IA2
54.	11	.	IA2
-----			
63.	1	.	IA3
66.	1	.	IA3
1.	1001		IA5
2.	1001		IA5

I have been trying to figure out whether I can recode these variables to match but having very little experience with svy, I am not sure on how to proceed.  
Any help will be much appreciated.

Thank you

Following is a response from Senior DHS Stata Specialist, Tom Pullum:

I don't know what variable you are using for "wave" but I will give it the name "wave", and assume it has the values 1, 2, and 3.

I suggest the following lines in the combined file:

```
gen v021_rev=v021
replace v021_rev=s021 if wave==3
egen cluster=group(wave v021)
```

You can then use "cluster" as the psu in the svyset command. It will not matter that the numbering scheme is different in the three waves, so long as they are all numeric.
