Subject: Mozambique weighting after merging datasets
Posted by SonjaMM on Thu, 03 Nov 2016 01:08:07 GMT

Hi, I merged the births, household, and household members datasets from Mozambique 2011. Which weight should I use? The births weight (v005) or the household and household members weigth(hv005). I am mostly looking at malaria and vitamin a relationship with covariates such as age, gender, province, region, vaccination, etc.
Thank you.
