Suppose you want to analyse data by applying weights but then there different weights for different data sets for example;

1. DHS 2016 which has different weights for women and men. Now when you want to analyse data by combining the two (men and women) which weight do you use in this context? e.g

tab number_hopitavlvisit sex [aw = men? or aw=women? or aw= women+men?]

2. when analysing DHS data for different years,say 2004, 2010, 2016, which weight will you use in such context
