Hi,

I would like to calculate the mortality history before nth child of a mother.

A.	B	C	D	E
1	3	1	0	1
1	2	2	1	0
1	1	3	0	0
2	5	1	0	3
2	4	2	1	2
2	3	3	0	2
2	2	4	1	1
2	1	5	1	0

Suppose, this is the data set. where

A= Mother id

B=Bord

C=Bidx

D=Mortality status

E=Mortality burden

I wish to calculate E. Please suggest how could I do that in stata.

Thanks in advance.

You post no explanation of what E means. What do codes 0, 1, 2, 3 mean here. Is this the number of prior deaths? I suggest you post the code that you have produced so far, and request how to modify the code to produce your variable of interest.
