Hello! I have an appended dataset that contains 10 countries that have the domestic violence module. In order to study the determinants of seeking help, i need to run a regression with seeking help as the dependant variable and some explanatory variables. However i have to do that for each of the countries. I know that i can use loop to do it once for all the countries but i can't figure out how and i am a beginner in Stata. Can you please show me the exact commands i need. (variable for countries is v000 , includes countries like C05 CO6 IA5 IA6 ZM6 PE6)

Thank you
