Hello! I have an appended dataset that contains 10 countries that have the domestic violence module. In order to study the determinants of seeking help, i need to run a regression with seeking help as the dependant variable and some explanatory variables. I have 10 countries and for each country there is 2 years of data, however its not panel data its cross sectional data. My advisor told me i should pool the countries together and run fixed effects but i only know how to run separate regression for each country. How can i do that? how will my regression equation be?

Dear User, please follow this thread

You may also want to refer to our newly updated Guide to DHS Statistics. This guide is fully searchable.

Thank you!
