Hello,

In the DHS spatial analysis reports 8, in Appendix C, there is a description of using regression calibration technique to estimate true distances to closest health resources.
STATA regression calibration function is suggested to be used.
My question is: is there a (syntax) code to do the regression calibration method in SPSS? is it even possible to do it in SPSS?
I would like to take into account the displacement of DHS Clusters in calculating distances from DHS clusters to the nearest health facility and the nearest local market, and I am working with Rwanda 2015 DHS cluster-level data.

Thank you for your help!
