Subject: using weights to make a provincial level data representative at district level

Hello!

This question is not in reference to DHS but I'm hoping to get help from someone through this forum.

How can we use weights on a data set that is originally representative at provincial level and make it representative at district level?
Since the variables I'm using are at a district level, using a provincially representative data set will result in a sampling bias. So I'm trying to somehow weight the data in a way that it becomes representative at the district level.

It would be of immense help if i can get a response for my query.
