Dear Sir,

Please I read this "Use of sample weights is inappropriate for estimating relationships, such as regression and correlation coefficients." in the guide to DHS statistics so i do not know what is it?

On mother's employment i meant if there is any approach to report descriptive statistics for let's say v714 whiles excluding mothers whose children died. Thus from the little understanding i have, a mother would appear as many times the number of children under five she has therefore if any of her children died, there wouldn't be any problem. Thanks so much

Best regards,

Mustapha Immurana
