A concentration index can be applied to many indicators.

<http://siteresources.worldbank.org/INTPAH/Resources/Publications/459843-1195594469249/HealthEquityCh8.pdf> provides information on the concentration

index. We do not have any code for applying it to DHS data.

For the anthropometric z-scores, I suggest looking at the WHO Child Growth Standards at

<http://www.who.int/childgrowth/standards/en/>. The Z-scores themselves are already calculated in the DHS datasets.
