Good morning,

In the recently published Chad DHS 2014-2015 report, data for indicator "Population 15-24 year-olds who have comprehensive correct knowledge of HIV/AIDS, female" is 11.2% based on 2471 cases. Compared to the results I have, 4% based on 6992 cases, following the same methodology.

Please note that I'm able to duplicate the figures for male age 15-24. I would like to check if there is any type of adjustment involved in the calculation for female. Please advice.

Many thanks.
