---

I am looking at all women who were selected for the domestic violence module, who also have an HIV outcome and whose partners also completed the survey. Should I use d005 or the female's hiv05? Should the psu be v021?

I have done:

```
generate wgt = d005/1000000
```

```
gen psu=v021
```

```
svyset glm w_hiv03 violence [psu] [iweight=wgt], family(binomial) link(log)
```

Also, I cannot seem to use family with svyset in STATA. I would be grateful for any guidance. Thank you.
