---

Greetings everyone.

I am using the 2014 KDHS to analyse tobacco use in the country but have realized the data set on individual and household member recode have no variables on smoking i.e. V463 A-E. The only one with the variable is the couples recode. Am lost on what to do as these variables are captured in the DHS. Also, the KDHS interviewed more than 36000 households but the I am only able to see less than 6000 responses from the recode files downloaded.

Anyone who can advise what am missing?

Many thanks in advance.

Peter
