Stillbirths are not included in the birth history - only live births. If you want to calculate mother's age at delivery for live births, you can use the BR (or KR) dataset and the following code:

```
gen mage_deliv = int((b3 - v011)/12)
```

The only information on stillbirths is collected in the calendar, and presented in table 8.5 of the report. This is estimated based on any non-live births in the last five years reported in the calendar. The data for the calendar (vcal\_1) can be found in the IR file.
