Subject: Simple domestic violence crosstabs

Hi,

I'm a journalist looking into the disadvantages faced by indigenous women. I'm making simple crosstabs in R to show the variation in domestic violence by ethnicity, using the individual recode datasets for a number of countries.

I just want to check if I'm correct in using the individual recode datasets, and that all I need to do is weight the data by the domestic violence weight variable (D005 or V005 in the case of Peru). Or do I also need to filter the data by any other variables before I weight the data (eg marital status/whether selected for the domestic violence module)?

Many thanks,

Will
