Thank you for the reply. I know about sisterhood method but that's not what I mean. What I'm trying to do is estimate adult mortality in Indonesia using indirect method. In "Tools for Demographic Estimation" by Tom Moultrie et al (I'm sorry I can't upload the pdf due to file size limitation), there's 2 indirect estimation method to estimate adult mortality. In chapter 22, there's orphanhood method. In chapter 23, there's estimation based on siblings data or well known as sisterhood method. What I'm asking is, when I'm going to estimate adult mortality based on orphanhood method using DHS Datasets, do you have any recommendation of what dataset recode I've to used ?
