Dears forum and experts,
I have produced some statistics from the different data sets (5):
-IR, HR, PR, BR. KR files of Burkina Faso DHS 2010 survey.
My attempts are to be able to analyze some outcomes relative to children and
mothers(mortalities) using one file that is suitable to compute these outcomes and reproduce the
correct statistics.
below is my script.
I would appreciate any help or suggestions
1- if merging these 5 data sets is possible without destroying the structure of some individual data
2- if my codes are correct.
I went through the forum and i notice that to keep the children that have died or living away is
tricky and do not get it well.
