Also (and apologies for taking advantage of your kindness), could you please explain how do you apply the formula we agreed on in order to retrieve the 26 strata specified in appendix A of the 2012 DHS survey for Haiti?

There are 10 departments + 1 metropolitan area. The then departments are divided in urban and rural. The metropolitan area (only urban) is stratified into its 6 municipalities. However, there is no variable disentangling the SDE from each metropolitan municipalities. In other words, I don't have enough information to use the code line you suggested before.

Another question is: how did you include the camps in the stratification strategy?

Thank you very much, once more.

Andrea
