The CR file is the couples recode file. The KR is the children under five recode file (sometimes known as the kids recode file). B16 is the children's line number from the household schedule and is needed when merging the children's data from the KR file with their information from the household schedule (PR file). The children's line number is not needed for merging with the CR file - you would merge based on the cluster (v001 <-> mv001), household (v002 <-> mv002), and the husband's line number from the women's recode (v034) with the respondent's line number from the men's data (v003).
