Following is a response from Senior DHS Specialists, Tom Pullum & Trevor Croft:

```
Tom Pullum:
```

```
Quote:Hi Bruno! I wonder how you determined this? I did the following:
```

```
set more off
use e:\DHS\DHS data\IR files\RWIR41FL.dta, clear
* youngest child has bidx k==1
* oldest child has bord k=1
rename b* 0* b* *
gen first cmc=.
gen last_cmc=.
local li=1
while `li'<=20 {
replace first_cmc=b3_`li' if bord_`li'==1
replace last cmc=b3 `li' if bidx `li'==1
local li=`li'+1
}
gen interval survey to last=v008-last cmc
gen interval_survey_to_first=v008-first_cmc
tab v201, summarize(interval_survey_to_last) means
tab v201, summarize(interval_survey_to_first) means
use e:\DHS\DHS data\MR files\RWMR41FL.dta, clear
```

So--I agree with you that the label should be changed and I will inform Data Processing. I wonder, however, whether the label is what they wanted and the calculation was done wrong.

gen interval=mv008-sm213c

<sup>\*</sup> Question: is the following closer to the first or second distribution above?? tab mv201, summarize(interval) means

<sup>\*</sup> Answer: much closer to the second. Thus sm213\* refer to the first birth, not the last

Trevor Croft:
Quote:The men's questionnaire refers to the "premier enfant" (first child). The only problem is with the label.

Good catch, as we say--Tom
