Dear DHS experts,

I am trying to replicate part of Table 11.1 Nutritional status of children from the Bangladesh DHS 2014 final report, and would be grateful for your help.

I am interested in the height-for-age below -2SD column by division, but am failing to reach the same values, with and without weighting. Can someone kindly have a look at this syntax and suggest where I may be going wrong? I am using the PR file, as another thread highlighted was necessary.

Syntax:

```
generate height4agesd = hc5 / 100
```

```
count if height4agesd >= 99 & height4agesd <=100
```

```
*178
```

```
replace height4agesd = . if height4agesd >= 99 & height4agesd <=100
```

```
generate stunting = .
```

```
replace stunting = 1 if height4agesd < -2.00
```

```
replace stunting = 0 if height4agesd >= -2.00 & height4age !=.
```

```
tab stunting
```

```
tab hv024 stunting
```

```
tab hv024 stunting [iweight=hv005/1000000]
```

Thank you in advance for your support!

Christina
