Hello,

I am trying to do analyze childhood stunting (<5 years) and some related demographic and mother characters. I am working on EDHS2014 KR recode. I am trying to calculate table 12.9 in the EDHS 2014 final report.

While calculation of the sample size of height for age (HW70), it was 13674 but in the report it was 13601.

I have applied the sample weight and turn 9996,9997,9998,9999 to missing.

How can i reach the sample size in the report?

Sincerely,

---
