Dear DHS experts,

I am trying to match a value presented in Kenya's 2014 final DHS report table 13.19, specifically the % of women 15-19 and 20-24 who used a condom at last sexual intercourse (also unmarried and had sex within past 12 months). My Stata syntax yields weighted proportions which are slightly off from those which are presented.

```
tab v761 if (v529 >=0 | v529 <= 12) & v535 == 0 & v013 == 1 [iweight = v005/1000000]
```

```
condom used |
during last |
sex with |
most recent |
partner |   Freq.   Percent   Cum.
-----+-----
no | 177.935511   44.03   44.03
yes | 226.186149   55.97   100.00
-----+-----
Total | 404.12166   100.00
```

55.97 should be 55.6 according to the table.

```
tab v761 if (v529 >=0 | v529 <= 12) & v535 == 0 & v013 == 2 [iweight = v005/1000000]
```

```
condom used |
during last |
sex with |
most recent |
partner |   Freq.   Percent   Cum.
-----+-----
no | 171.948023   34.77   34.77
yes | 322.565111   65.23   100.00
-----+-----
Total | 494.513134   100.00
```

65.23 should be 64.8 according to the table.

I'm appreciative for your support, as I'm unsure why I'm not able to match these proportions exactly!

Kind regards,

Christina Mergenthaler
