Thank you. Just to clarify.

So with this code, if someone's caseid is 2 1 66 4 and another's caseid is 2 1 66 7, then they belong to the same household with hhid 2 1 66? Thus there are two individuals belonging to the same household?

With this hhid, can i generate household fixed effects in a regression either by i.hhid as a regressor or by manually generating household dummies?

Regards,
