Following is a response from Senior DHS Stata Specialist, Tom Pullum:

The way to deal with long lines is with #delimit. (Enter "help delimit".) Here's an example of how you change to a long line with a semicolon an the delimiter and then back to regular lines in a program:

#delimit; Enter your long line here; #delimit cr

You can have multiple lines between the two "#delimit" statements, but there must be a semicolon at the end of, or after, each such line.

The normal delimiter is an end of line mark, which is not visible in a text file, but is referred to as "cr" for "carriage return", harking back to the days of typewriters.
