Hello together,

first I want to say thank you for this great forum. It helps me a lot. I have read in this forums many questions about merging data files from

the same year but different questionnaires.

I analyze the DHS data of Lesotho 2004 to 2014. I use SPSS. I want to merge the different Datasets, only the IR-Record together in one file to

make a chi square of significant differences. Can anyone help me? I must note somethings else because of weighting and my planfiles?

Thank you very much.

Many greeting from Germany!
