Subject: Merging datasets in SPSS

Hi, I've been trying to understand and work with DHS dataset on SPSS. My research question is to explore predictors of breastfeeding initiation, exclusive breastfeeding and bottle feeding in Ethiopia.

I have some queries around merging datasets in terms of bringing one variable from one dataset to another. For example, I want to bring a variable "Antenatal care" from household dataset to children's dataset. Given the IDs are different in both datasets, I am quite confused how to work this out. Can you please advise on this.

Thanks.
