Hi, I've been trying to understand and work with DHS dataset on SPSS. My research question is to explore predictors of breastfeeding initiation, exclusive breastfeeding and bottle feeding in Ethiopia.

I have some queries around merging datasets in terms of bringing one variable from one dataset to another. For example, I want to bring a variable "Antenatal care" from household dataset to children's dataset. Given the IDs are different in both datasets, I am quite confused how to work this out. Can you please advise on this.

Thanks.
