Thank you for your efforts!

I want to analyze if there is a significant association between five-year age group and knowledge of AIDS among men. I merged women's and men's data, so my variables are v751 and v013. My analysis just includes ages 15-49 years.

I made it in the following way:

```
svyset [pw=wgt1], psu (v001) strata (v023)
svy: tab v013 v751 if gender== "men", missing row
```

The output includes:

Pearson:

```
Uncorrected chi2(12)    = 17.3136
Design-based F(9.81, 5109.55)= 1.2050   P = 0.2830
```
