Many thanks for your reply. Since I am using the KR file, I searched for b19 in the file, but no such variable was found. I checked section W21 (for the birth variables) in the DHS-VI recode manual since that was the recode structure in the survey summery. The last B variable listed is B16. I am not sure what I am doing incorrectly- I would be grateful is you could clarify?

Also, yes I did use weights. The entire svyset procedure I used is:

```
generate weight = v005/1000000  
egen strata = group(v024 v025), label  
tab strata  
svyset [pweight=weight], psu(v021) strata(strata)
```

with the weight used as specified above

Many thanks again in advance for your help!
