Thank you so much for your help.

I wanted to ask which is the correct strata variable in Pakistan DHS 2012-13, v023 or v022. I used this command:

```
svyset [pweight=weight], psu(v021) strata(v023)
```

v023 is simply provinces classified as rural or urban while, v022 are 78 strata (numbered), so which one is recommended in the svyset command?

If v023 is the correct variable and I use it and I include province level dummies in the regression, would the inclusion of the province dummies be rendered useless?

Your assistance will be very valuable to me.
Thank you.
