Hey all,

I am using Brazil data (DHS 1996). I do need to create the variable "family arrangement". It's seems to be derived from "relationship to head" variable.

I have 18 variables related to relationship to household head (HV101\$01 until HV101\$18) (18 is the maximum number of people in a household). So it allows different combinations.

Can you help me? Do you have a syntax for this?

Thank you,  
Flávia
