According to the content of the file attached to my first post, the child mortality calculation program must be adjusted to the estimation method principle in order to:

1. standardize death exclusions at the upper limit of periods;
2. ensure equity in the treatment of age groups (0, 1-2, 3-5,6-11,12-23,24-35,36-47 and 48-59 months) which are unequal in length.

Best regards and waiting for an informed response on the matter.
