You just need to follow the logic used before which calculated the proportion ever married, and add the following to calculate proportion currently married and proportion never married:

* Currently married

gen currmarr = (v501==1)

svy: ratio currmarr/aw, over(v013)

* Never married

gen nevermarr = aw - evermarr

svy: ratio nevermarr/aw, over(v013)

This will provide you with the estimates in the first couple of columns in table 4.1.
