The files called UGHR60FL.FRQ, UGHR60FL.FRW, and UGHR60FL.MAP give descriptions/tabulations of all variables in the UGHR60FL dataset. You can open these in Notepad/textedit, and do a search (CTRL F) for district, county, etc. If the vbl is in the released dataset, you should be able to see what the name is in the dataset. Check also the Individual Recode file if you can't find it in the HH recode dataset. Remember that Stata is case-sensitive

HTH,

rhs
