I have two follow up questions on the response below:

1. I want to categorise children whose parents are de jure household members, whose parents are migrants (living elsewhere for extended periods), those whose parents are not part of the household because they are dead or are "absent". I am having challenges to do it in stata. I copied your code below for the first two categories but having problems with the rest.

2. Are there other countries besides Lesotho that include individuals who are neither de jure nor de facto members?
