Following is a response from Senior DHS Stata Specialist, Tom Pullum:

The variables mg123 and mg124 come from the survey of men. The questions on FGC asked of men are parallel to those asked of women in the survey of women. In the MR data file (SNMR4GFL.dta, for Stata) the variable names match with those in the IR data file, but with the letter "m" at the front of the variable name. The first variable is about the man's own attitude and the second question is about his perception of men's attitudes in general.
