
Subject: Proportion estimates from indicators in both long and short questionnaires
KDHS 2014

Hello,

I am trying to estimate proportion of mothers who attended at least one ANC visit during pregnancy using the Kenya DHS 2014. My greatest concern is that two sets of questionnaires (long and short) were used during the survey. Antenatal care and delivery being part of the indicators from both questionnaires how can i specify a stata command to estimate the proportion of women who attended at least one ANC at regional level?

Thanks
Njoseph
