Subject: Missing data
Posted by Dsisso on Fri, 07 Feb 2014 06:39:07 GMT

Hello everybody,
I am working on an immunization dataset in which I like to impute missing values on DTP1,2 and 3 doses and to calculate the prevalence of unimmunized by each vaccine dose. Is someone experienced the same problem? In STATA, I am able to impute multiple imputed datasets but I am experiencing difficulties in combining all imputed dtatsets to one containing complete information per observation. So far, in my understanding, I can only combine estimates (e.g, coefficients by using logistic regressionand Rubin rule or combination) while I want to rather generate categorical DTP1,2,3 with missing values filled by multiple imputation procedure.
Thank you for our help,
Dsisso
