Subject: Re: Variable for Age-Specific Fertility Rate Posted by kbietsch on Wed, 20 Sep 2017 17:57:18 GMT View Forum Message <> Reply to Message

What I have done in the past for decomposition of fertility rates is to create my birth count for individual women(usually in the last 3 years, the same cut off as TFR), create my exposure (usually 3 years, less for teenagers). Then I do a decomposition of a Poisson regression, with births as my outcome, and offset with exposure. I include dummy variables for ages groups, then you will be able to see the differences in the composition of the age groups, as well as the differences in rates. I use the mvdcmp package.
