Hi

Do you have any idea how to merge male dataset and female dataset to make a couple dataset. I could not understand the value in V034 and MV034\$1, those are too different, where female dataset has value 1 is more common and male dataset has value 2 more common and there are other different values, so how could we match the couple based on these values. How do we know which is the couple (1 female and 1 male is couple or 1 female and 2 male is couple).

If you have any command in Stata or R or other software, please share it, my e-mail:
