Dear,
I am carrying the study primarily based on data from Ethiopian DHS 2000, 2005, 2011 and 2016
EDHS on women file recode. The unit of the study are women in reproductive age (15 - 49). I am
planning to see further analysis on women's' maternal health care utilization at different levels
(Individual Vs Community Level). Would you give me a clue on which the community Cluster level
variables that exist in these Ethiopian DHS? Also, I need your professional explanation on
Challenges and limitations of using big DHS data sets. Thank you so much in advance for sharing
my concern.
