Hello,

I am attempting to replicate Table 2.4 from the Malawi 2010 DHS Report.
Find my (stata) code below:

gen weight=hv005/1000000
svyset [pw=weight], psu(hv021) strata(hv022)

svy:tab hv122 if inrange(hv105,6,13) & hv025==1 & hv104==1 & hv103==1 /// range given in the
notes in DHS Final report Table 2.4 where hv103==1 is defacto, hv025==1 is urban, and
hv104==1 is male.

Output from this code is giving me that ratio attended =92.76% instead of 96.3% as reported in
the DHS Report.
May you kindly tell me where I am getting this wrong?

Thank you.
