Hi Lupe,

Thank you very much for the help. Appreciate your support.

Well, if I can ask you some of my queries please. why sort by caseid bidx at one time and also by caseid and midx at another and rename bidx=midx. I could not make sense of it.

Do we have to select alive children (B5=1)??

How we select youngest children living with mother for determining exclusive breastfeeding and predominant and so on? Do you have idea of this in SPSS? I think I am having error here, my result differ my few percentage with that of report.

And If you have English version please.

thanks
S
