

I am using the 2013 Namibia DHS data in one of the projects of my MPH students here at the University of Pretoria.

Please refer to Table 11.5 in the report.

I do not get these numbers at all when I use the children's recode data set, namely NMKR61FL.

e.g. below are the numbers/frequencies for the age categories I get

The SAS System 09:45 Thursday, November 16, 2017 16

The FREQ Procedure

agecat	Frequency	Cumulative Percent	Cumulative Frequency	Cumulative Percent
ffffffffffffffffffffffffffffffffffff				
ffffffffffffffffffffffffffffffffffff				
1	271	13.93	271	13.93
2	251	12.90	522	26.84
3	430	22.11	952	48.95
4	374	19.23	1326	68.17
5	323	16.61	1649	84.78
6	296	15.22	1945	100.00

Frequency Missing = 3101

```
data xxx ;  
set xxx ;
```

```
agecat = . ;
```

```
if hw1 ne . and hw1 > 47 then agecat = 6;  
if hw1 ne . and hw1 < 48 then agecat = 5;  
if hw1 ne . and hw1 < 36 then agecat = 4;  
if hw1 ne . and hw1 < 24 then agecat = 3;  
if hw1 ne . and hw1 < 12 then agecat = 2;  
if hw1 ne . and hw1 < 6 then agecat = 1;
```

```
run;
```

I get many missing values for the age categories, even in the FREQ file it is the same.
